

# Well iOS Engineer Interview Assignment

Please create an app with a List view and Details view that matches the following design:

List view

Details view

**The app should download and utilize the following test data:**

<https://gist.githubusercontent.com/DavidCorrado/8912aa29d7c4a5fbf03993b32916d601/raw/681ef0b793ab444f2d81f04f605037fb44814125/pokemon.json>

**Please consider the following when working on this assignment:**

- Match your application's design to the provided images.
- Download the test data file using the URLSession framework (no 3rd party frameworks).
- Create the app using Swift.
- Create a single application with two versions of the screens - one version in SwiftUI and one version in UIKit. Provide a mechanism to switch between the two versions in the app.
- Use the MVVM pattern for both SwiftUI and UIKit.
- Create the UIKit screens using .xib files (not storyboards) and auto layout in Interface Builder.
- Bonus points for adding UI tests for the screens.
- When creating your project and sharing with our team, please ensure that the repository you are using is private and you are sharing directly with someone on our team.
